List of contents

Introduction to European Spot Gas Markets (ESGM)

European Spot Gas Markets (ESGM) contains independent price assessments and indices for mature and emerging gas markets, as well as in-depth analysis on price drivers, authoritative commentary on each day's trading activity and daily news. Coverage for some markets stretches back as far as 1994 and a comprehensive price history database is available for this report.

ESGM is published every English working day in the evening as a PDF with data also available through an FTP feed.

An additional service for early price assessments on key markets is available. This service is called ESGM Intraday Update.

General methodology

ICIS continuously develops, reviews and revises its methodologies in consultation with industry participants. Product specifications and trading terms and conditions used are intended to reflect typical working practices prevalent in the industry.

ICIS publishes market assessments based on information continuously gathered from market participants about: spot transactions, spot bid and offer levels, contract price negotiations, prices of related commodities, and relevant freight costs.

ICIS does not make retrospective adjustments or changes to price assessments based on information received after publication time in all cases or after any cut-off point specified in individual methodology documents.

ICIS regards all arm's-length transactions which meet its specification criteria as carrying equal weight.

ICIS uses proprietary models where necessary to normalise data to the typical specifications for cargo size and date ranges given for each commodity.

Some ICIS assessments are the product of calculation alone, for example in markets where insufficient market activity takes place to permit price assessment, or where a market habitually itself sets prices according to a formula. Such calculated assessments are noted as such in their detailed methodology specifications.

ICIS endeavours to cross-check all the transaction information it gathers. ICIS will not use information for assessment purposes where such checks call into doubt the accuracy of the original information, or where a transaction appears to have occurred under circumstances that render it non-repeatable or otherwise markedly unusual.

Rationale for gas methodology

All ICIS gas prices contained in ESGM are intended to provide a reliable and accurate measure of physical market value on the over-the-counter traded markets.

In order to do this, ICIS has adopted two different methodological approaches, which can be applied as reliable measures but at different stages in the development of trade at a particular location: assessment and index.

Assessment

For markets at all stages of development, ICIS deems its assessment methodology to be appropriate. This methodology is designed to discover the tradable value of a commodity at a particular point in time. It is particularly useful in allowing a comparison in value across various geographies and for various delivery periods. Most assessments in ESGM are made at the close of the trading day, as this is the time at which most companies need to mark their positions to market and finalise their physical trading positions. ICIS provides earlier assessments for some markets as an additional service, subject to customer demand and market liquidity.

The Bid and Offer range published in ICIS assessments represents the highest buyer's bid and the lowest seller's offer at the relevant closing time of each market.

Some companies choose to use the midpoint between this bid and offer as the best indicator of market value.

ICIS uses transaction data as well as bid and offer data in its assessment process. Transaction information is used to verify bid or offer information when available.

Where a transaction can be confirmed at exactly the time of the published market close, it will not necessarily supersede a firm bid-offer spread. This is because on the more active gas markets, ICIS considers the depth and continuity of bid/offer information to be the most reliable measure of market value. On the less active contracts, there will not typically be a transaction exactly at the ICIS published assessment time. See the section entitled "Exercise of judgement" below.

Index

An index is formed using transaction data only. This methodology can provide a reliable measure of market value when markets have developed to a point of relatively high liquidity. A mechanistic, deals-based index for a contract with low liquidity leads to erratic switches from defined default methodologies.

This is why ICIS will not typically publish an index until it has at least six months' worth of data showing that at least 10 deals have been completed for each index period.

Indices are not considered to be an accurate way to represent price differentials between different geographies and delivery contracts, as they do not represent market value at a set point in time but rather an average of deals done over a given period of time.

All ICIS indices are formed of a weighted average of deals done. Criteria for inclusion or exclusion of deals are described below.

The indices are published as a single value, to three decimal places.

Primary price references published in ESGM are as follows:

Hub	Assessments	Indices	Units quoted
British NBP	Day-ahead, Weekend, WDNW, BOM, six months ahead, 11 quarters ahead, 10 seasons ahead, two gas years ahead and two calendar years ahead	Within-day, Within-day Cumulative, Day-ahead, Day-ahead Cumulative, Weekend, Spot Weekend, Monthly, Monthly Cumulative, Daily Month Ahead, Volatility Index	p/th
Belgian Zeebrugge	Day-ahead, Weekend, WDNW, BOM, three months ahead, six quarters ahead, three seasons ahead, one gas year ahead and one calendar year ahead	Day-ahead, Day-ahead Cumulative, Weekend, Spot Weekend, Monthly, Monthly Cumulative, Daily Month Ahead	p/th
Belgian ZTP	Day-ahead, Weekend (only on the last English working day of the week), one month ahead, one quarter ahead and one season ahead		€/MWh
Dutch TTF	Day-ahead, Weekend, WDNW, BOM, six months ahead, 10 quarters ahead, 10 seasons ahead, one gas year ahead and four calendar years ahead	Day-ahead, Day-ahead Cumulative, Weekend, Spot Weekend, Monthly, Monthly Cumulative, Daily Month Ahead	€/MWh
French PEG Nord	Day-ahead, Weekend (only on the last English working day of the week), BOM, three months ahead, three quarters ahead, three seasons ahead and one calendar year ahead	Day-ahead, Day-ahead Cumulative, Spot Weekend, Monthly, Monthly Cumulative	€/MWh
French PEG Sud	Day-ahead and Weekend (only on the last English working day of the week) and one month ahead	Day-ahead, Day-ahead Cumulative, Spot Weekend	€/MWh
French PEG TIGF	Day-ahead and Weekend (only on the last English working day of the week)		€/MWh
German NCG	Day-ahead, Weekend, WDNW, BOM, four months ahead, four quarters ahead, five seasons ahead and three calendar years ahead	Day-ahead, Day-ahead Cumulative, Spot Weekend, Monthly, Monthly Cumulative, Daily Month Ahead	€/MWh
German GASPOOL	Day-ahead, Weekend, WDNW, BOM, three months ahead, four quarters ahead, five seasons ahead and three calendar years ahead	Day-ahead, Day-ahead Cumulative, Spot Weekend, Monthly, Monthly Cumulative	€/MWh
Austrian VTP	Day-ahead, Weekend (only on the last English working day of the week), three months ahead, two quarters ahead and three seasons ahead	Day-ahead, Day-ahead Cumulative, Spot Weekend	€/MWh
Italian PSV	Day-ahead, Weekend (only on the last English working day of the week), BOM, three months ahead, four quarters ahead, two seasons ahead, one gas year ahead and one calendar year ahead	Monthly, Monthly Cumulative	€/MWh
Czech VTP	Day-ahead, Weekend (only on the last English working day of the week), BOM, two months ahead, two quarters ahead, one season ahead and one calendar year ahead		€/MWh
Spanish AOC	One month ahead		€/MWh
Turkish UDN	Day-ahead and 7-day ex-post. Individual Forward Weekend days published on a Friday only. Ex-post Weekend days assessed individually for the days following the latest Ex-Post assessment	Day-ahead, Week	TL/1,000sm3. Converted to €/MWh, \$/MWh and \$/MMBTu

Definition of hubs

NBP: The British virtual gas hub operated by transmission system operator (TSO) National Grid, covering all entry and exit points in mainland Britain.

Zeebrugge: The physical gas hub at Zeebrugge (Zee Beach) in Belgium operated by Huberator, a 100% subsidiary of Belgian TSO Fluxys.

ZTP: The virtual gas hub in Belgium operated by Belgian TSO Fluxys.

TTF: The virtual gas hub covering all high calorific entry and exit points in the Netherlands, operated by Dutch TSO Gas Transport Services.

GASPOOL: A subsidiary of DONG Energy Pipelines, Nowega, Gastransport Nord, Gasunie Deutschland Transport Services, ONTRAS – VNG Gastransport and Gascade. With the integration of the market area H-Gas Northern Germany, Statoil Deutschland Transport is also involved in this market area cooperation.

NCG: NetConnect Germany is a joint company for operating the market area cooperation from the grid companies bayernets, Fluxys TENP, Open Grid Europe, GRTgaz Deutschland, terranets and Thyssengas.

PEG Nord: The French virtual gas hub covered by the high calorific entry/exit north market zone operated by GRTgaz.

PEG Sud: The French virtual gas hub covering the southern market zone operated by GRTgaz.

PEG TIGF: The French virtual gas hub covering the southwest market zone operated by TIGF.

VTP: The Austrian Virtual Trading Point operated by the Central European Gas Hub (CEGH).

PSV: The virtual gas hub run by Italian network operator Snam Rete Gas.

Czech Republic: The virtual gas hub, VTP, covering the Czech Republic, operated by NET4GAS.

AOC: The virtual gas trading point covering the Spanish transport system, operated by Enagas. Excludes underground storage sites and LNG terminals.

Turkey: The virtual gas hub, UDN, operated by BOTAS. This excludes system entry points.

Recent changes to this methodology

Date	Price reference	Change
7 August 2013	N/A	Adds detail. Removes repetition. Corrects index threshold wording
28 May 2013	Turkish gas prices, trade table, BOTAS balancing price	Added
18 March 2013	Czech Republic BOM, second month ahead, front season; PSV third month ahead, second, third and fourth quarters ahead; NCG fourth month ahead; GASPOOL fifth season ahead; PEG Nord third quarter ahead, front year	Additional price assessments
2 January 2013	VTP price assessments and indices	Replaced CEGH price assessments and indices
26 November 2012	PEG Nord BOM price assessment; PSV BOM, front quarter, front season and front year price assessments	Added
29 October 2012	Czech Day-ahead price assessment	Added to End-of-day Day-ahead Closing Prices
1 October 2012	ZTP prices and trades	Added

Price assessments

General definitions

All price assessments published in ESGM represent ICIS' close-of-day bid-offer ranges for flat gas (no swing, 100% take-or-pay) delivered at a number of physical and virtual hubs.

Day-ahead and all other prompt closing prices (defined as all contracts with delivery up to Balance-of-month) are assessed at 16:30 London time on all English working days, except on the final working day immediately preceding 25 December and 1 January each year, when these prices are assessed at 12:00 London time.

Curve prices (defined as all contracts from the front month forwards) are assessed as closely as possible to 16:30 London time at the earliest or at the time of the latest liquid market if this is after 16:30 on all English working days, except on the final working day immediately preceding 25 December and 1 January each year, when these prices are assessed as closely as possible to 12:00 London time.

Assessments are based on bids and offers widely available to the market at the ICIS closing times above.

"Bid" is deemed to be the highest price bid by buyers at the published assessment time.

"Offer" is deemed to be the lowest price offered by sellers at the published assessment time.

Price assessments – Guidelines for the exercise of judgement

ICIS gives priority to the highest bid and the lowest offer in its assessment process.

ICIS first attempts to establish a firm bid/offer spread as the basis for all of its assessments. ICIS also discovers transaction information. This transaction information is used as supporting evidence to establish market value. Where this transaction information is within the established bid/offer spread it may also be used to narrow the ICIS assessment bid/offer spread.

Where no confirmed transaction or bid and offer information is available at the time ICIS assesses the market, it will use other types of market information to assess value.

The most regular form of alternative market information used to make assessments is the value of spreads, either between contracts for different delivery periods on the same hub or between contracts for the same delivery period on other European hubs.

The value of component periods within a given contract will typically be used where confirmed market information is available for these component periods and not the contract itself. Similarly, where confirmed market information is available for a contract for a longer delivery period, this will typically be used to assess component contracts.

Where only a bid or offer is available, or where the bid/offer spread is wider than the ICIS published maximum (see section below: “Width of bid/offer spreads”) at the time ICIS assesses the market, confirmed spread information may take priority over bid/offer information in forming the assessment.

Where transaction information is available at the assessment time, it may be superseded by market spread information in instances where the transaction is deemed not to be repeatable. ICIS may make this judgement in cases where there is no bid/offer information immediately following the transaction to support a movement in value. It may also make this judgement where a single deal at the closing assessment time falls outside of the prevailing range of confirmed bid/offer or spread activity at other times of day. This logic also applies to situations where a bid/offer spread at the close is uncorrelated with the rest of the day’s market activity and where ICIS can discover no fundamental reason for the change in market structure.

ICIS may also disregard transaction information where the deal is for a contract with a delivery period overlapping another more liquid contract, and where market information for the more liquid of the two indicates a different price level or price trend. This is because on actively traded gas markets, participants do not typically leave arbitrage between a contract and its constituent parts.

ICIS only uses geographic spread information between hubs where a strong price correlation has been demonstrated by past trading activity.

ICIS discovers the value of both time and geographic spreads through both the collection of spread trade and

bid/offer information, as well as the relationship between hubs when both outright contracts are trading.

Where ICIS uses spread information in its assessment process, it gives priority to information available for 16:30 London time. If this is not available, it will take evidence of market activity closest to this time.

Where a market typically does not trade as a spread to other markets and where there is no confirmed bid/offer or transaction information at the time of the closing assessment, ICIS may use bid/offer or transaction information closest to this time.

Price assessments – Exclusion of data

In line with its Editorial Standards policy, ICIS reporters actively seek to identify anomalous market information and exclude it from the assessment process. For gas market assessments, this is done by the daily information gathering and verification process carried out by reporters, whereby market transaction, bid and offer information is confirmed and verified by multiple sources. The context of ICIS reporters’ knowledge of the fundamental supply/demand situation on a given market is also used to verify transaction data that appears to be anomalous but may be done at a price level explained by changes in the physical market.

In assessing gas markets, ICIS takes into consideration only arm’s-length transactions between non-affiliated parties.

ICIS does not accept bids or offers that are not firm. Any bid or offer which is demonstrably not firm will be disregarded and further bids or offers from the same counterparty may also be disregarded. For example, if a company indicates to the market that it is bidding or offering at a certain price and volume but ICIS can confirm that it later refused to transact when that bid was hit or offer lifted, it will not use that company’s bid/offer information.

ICIS also excludes from its assessment process transactions where ICIS reporters have reasonable grounds to doubt the transaction is representative of typical market behaviour: for example, where a deal is concluded disregarding the best bid or offer on the

market; where there is evidence that a market participant has disclosed only part of its market activity to ICIS; or where a transaction lies outside the prevailing range of typical market activity as established through other market evidence.

ICIS actively seeks to verify the time at which reported transactions took place. If such verification cannot be obtained, ICIS may exclude the transaction information.

ICIS records instances of anomalous data and reviews these instances on a regular basis with a view to determining if a pattern exists.

Where market reporters have concerns over the behaviour of a market participant, this will be escalated using the ICIS Escalation Process for Compliance and Regulatory Issues. This can be found in the company's Compliance Manual.

Price assessments – Indicative assessments

Where a bid and offer at the assessment time have not been confirmed by ICIS, the assessment will be marked as indicative.

ICIS seeks confirmation from at least three independent and non-affiliated market participants in order to assess a price as non-indicative.

If spread value has been confirmed at the assessment time and the price of the related outright contract value has been confirmed, ICIS will not mark an assessment as indicative.

For example, where the value of the basis contract (spread between the NBP and Zeebrugge markets) has been confirmed and the NBP closing assessment is confirmed, the Zeebrugge assessment will not be marked as indicative.

ICIS will not publish a bid/offer spread wider than 0.5p/th or €0.5/MWh. If the confirmed bid/offer spread is wider than this range, ICIS will narrow the spread using the alternative market evidence described above and mark the assessment as indicative.

Price assessments – Width of bid/offer spreads

ICIS publishes a minimum bid/offer spread of 0.025p/th or €0.025/MWh and a maximum of 0.5p/th or €0.5/MWh.

The exception is the Turkish market, where there are no maximum spread limits at the time of the latest methodology update. The Turkish market is in the very early stages of development. Transactions are still occurring at widely varying prices not always dictated by market fundamentals, making it impractical and unrealistic to narrow bid/offer spreads.

Price assessments – Types of market information used and collection process

ICIS gathers market information primarily via telephone, instant messenger and e-mail. Lists of transactions are primarily collected electronically and ICIS employs a data management team to collect and de-duplicate this data. ICIS has designed bespoke programmes to standardise the various data feeds received, for the purposes of reporter verification and publication.

Market information includes bids, offers and deals done by sources or seen/heard by sources. ICIS reporters also investigate the reasons for market price movements and cross-check information received against market fundamentals data, primarily gathered from transmission system operators.

Information is typically gathered between 10:00 and 17:30 London time on the day the assessment is published. ICIS may disregard information received after 17:30 London time.

On the working day immediately preceding 25 December and 1 January, ICIS assesses markets earlier and gathers information between 09:00 and 13:15 London time.

ICIS will never use information received after assessments have been published to retroactively correct an assessment.

Price assessments – Transaction data threshold

ICIS does not impose a minimum transaction data threshold on its assessment process.

Alongside its role in assessing the more active and mature gas markets, ICIS plays a role in bringing price transparency to new markets where trading and market information can be sporadic. Such markets are not conducive to minimum data thresholds.

In the absence of both transaction and bid/offer information, ICIS procedures are described above in the “Exercise of Judgement” section.

ICIS does impose a minimum data threshold on its indices, however (see section below: “DEFINITION OF HEREN INDICES”).

Price assessments - Verification of sources

ICIS verifies that all sources are active participants of the European gas markets by checking they have a shipper and/or supplier licence or are registered to trade at a relevant venue.

In addition, ICIS reporters use the indicators contained in the section entitled Validation Checks on Sources from the company’s Data Standards Policy. This policy can be read in full in the ICIS Compliance Manual.

Price assessments – Definitions of periods

All periods quoted are based on the standard European definition of the Gas Day. This runs from 06:00:00 until 05:59:59 local time on the following day. The exceptions are as follows:

1. Turkey 08:00:00 to 07:59:59 local time.
2. Spain, 0:00:00 to 23:59:59 local time.

All prices are for flat gas, no swing and 100% take-or-pay to be delivered for the duration of the contract to the hub.

Prompt contracts:

Day-ahead: This refers to the next working Gas Day in England following the date of the report. In a report published on Friday, Day-ahead would normally apply to the following Monday, provided that Monday is not a public holiday. In this case, Day-ahead would refer to the next working day, that is Tuesday.

7 Day ex-post: (Turkish market only) This is the price traded the day after delivery and reported by ICIS seven days after the transaction date. Transactions are financial and not physical. Saturday and Sunday assessments are published separately, rather than a Weekend contract, and appear on the second Monday following the transaction dates, assuming this is an English working day. If the Monday is not a working day in England, the assessments are published on the next working day.

Weekend: This covers the first Saturday and Sunday following the date of the report. Other contiguous non-working days – typically Bank Holiday Mondays and Good Friday – will be added to the contract to create a three- or four-day delivery period.

When Christmas Day and Boxing Day (25-26 December) and New Year’s Day (1 January) fall mid-week these shall be considered additional Weekend delivery periods. For example, if 25-26 December fall on a Tuesday and Wednesday, the Weekend contract quoted on the Monday of the same week would refer to Tuesday and Wednesday. The weekend after 25-26 December would be assessed as a contract for the first time on 27 December.

WDNW: The contract covers the Working Days Next Week period to be delivered on every working day in the week following the date of the report. Typically this covers the five days following the next Weekend contract. In the case of a three-day weekend covering Saturday to Monday, Monday would be excluded from the WDNW contract, which would instead cover Tuesday-Friday.

Similarly, in the case where Christmas Day and Boxing Day (25-26 December) fall on a Tuesday and Wednesday, the WDNW contract assessed on the previous Friday (21 December) will refer only to the following Monday (24 December). The WDNW contract assessed on Monday (24 December) will refer to Thursday and Friday (27-28 December) only.

BOM: Balance-of-month is for delivery on each of the remaining days of the current month, excluding the next Day-ahead or Weekend contract, whichever is the sooner.

For example, on a Thursday, BOM would normally apply from the following Saturday to the end of the month (remaining days of the month minus Day-ahead). On a Friday, BOM would normally apply from the following Monday to the end of the month (remaining days of the month minus Weekend).

Should the next Day-ahead or Weekend contract cover the last day or days of the current month, the delivery period to which BOM applies will switch to the next month. Should the next Day-ahead or Weekend contract cover the first day or days of the next month, BOM will apply to the subsequent days of that month.

Curve contracts:

Months: Monthly contracts refer to the Gas Days of the standard calendar months.

Quarters: A Quarter refers to the Gas Days of the three-month periods beginning on 1 January (Q1), 1 April (Q2), 1 July (Q3) and 1 October (Q4).

Seasons: A Season refers to the Gas Days of the six-month period running from either 1 April - 30 September (Summer) or from 1 October of one year to 31 March of the following year (Winter). The title of the Winter always refers to the year in which the contract commences. For example, Winter 2013 starts on 1 October 2013.

Years: A Year refers to the Gas Days of the 12-month period from 1 January-31 December.

Gas Year: A Gas Year refers to the Gas Days of the 12-month period from 1 October of a particular calendar year and ending on 30 September of the following calendar year. The title of the Gas Year always refers to the year in which the contract commences. For example, Gas Year 2013 starts on 1 October 2013.

Indices

The Heren Index – General definition

All ICIS' market indices are volume-weighted averages of trades gathered and verified by ICIS during the course of its market reporting activities. All of the trades verified by ICIS and not excluded according to the criteria set out below are published by ICIS on a daily basis via its FTP service and transactions for a selection of key contracts are summarised in ESGM on a daily basis.

Indices – Guidelines for the exercise of judgement

ICIS reporters are responsible for identifying anomalous trades and excluding them before the index is calculated. Please see the section below "Criteria for Exclusion of Data".

Indices – Criteria for the exclusion of data

In line with its Editorial Standards policy, ICIS reporters actively seek to identify anomalous deals and exclude them from the index creation process. For gas market indices this is done by the daily information gathering and verification process carried out by reporters, whereby transaction information is confirmed and verified by multiple sources.

Confirmation is sought from both parties to the deal. If, as is often the case, both counter-parties are unwilling to confirm, confirmation is accepted from one side only. However, corroboration is also sought from other market participants. If no direct confirmation is available, the deal may still be included if it is corroborated by other market sources and if ICIS itself regards it as being within the prevailing market trend for the period in question.

ICIS only accepts arm's-length transactions between non-affiliated parties for inclusion in its indices.

ICIS does not accept "wash" or "round-trip" trades for inclusion within its indices.

ICIS excludes from its indices transactions where market reporters have reasonable grounds to doubt that a transaction is representative of typical market behaviour: for example, where a deal is concluded disregarding the best bid or offer on the market; where there is evidence that a market participant has disclosed only part of its market activity to ICIS; or where a transaction lies outside the prevailing range of typical market activity as established through other market evidence.

The context of ICIS reporters' knowledge of the fundamental supply/demand situation on a given market is also used to verify transaction data that appears to be anomalous but may be done at a price level explained by changes in the physical market.

Deals may be excluded if ICIS is not able to satisfactorily confirm the transaction time.

Deals done in non-standard volumes will be automatically excluded from ICIS indices. See "volume" section below.

Where sleeve deals have been identified and are not deemed to be off-market, ICIS will remove one leg of the sleeve in order to prevent skewing of the index through double volume reporting for one agreed transaction price.

ICIS records instances of anomalous data and reviews these instances on a regular basis with a view to determining if a pattern exists.

Where market reporters have concerns over the behaviour of a market participant, this will be escalated using the ICIS Escalation Process for Compliance and Regulatory Issues. This can be found in the company's Compliance Manual.

Indices – Volume

Deals deemed non-standard in volume size will be automatically excluded. For gas markets this means deals of a clip size which is not a multiple of 5,000 therms/day or 5MWh/h.

ICIS sets a maximum volume limit above which deals will automatically be excluded as non-standard. For the NBP and Zeebrugge hubs the maximum volume is two million therms for all prompt deals and 500,000 therms for all curve deals. These limits apply to the amount being delivered per day.

For all other European markets the maximum limit is 2,000 MWh/hour for prompt deals and 300 MWh/hour for curve deals.

For markets in the early stages of development or low liquidity these parameters are not applied. Markets falling into this category are the Turkish, Spanish and Czech markets. French hubs fall into this category because of the difference in traded units (see section below: ESGM Trades Tables).

Indices – Types of market information used and collection process

ICIS gathers market information via telephone, instant messenger and e-mail. Transactions are primarily collected electronically and ICIS employs a data management team to collect and de-duplicate this data. ICIS has designed bespoke programmes to standardise the various data feeds received, for the purposes of reporter verification and publication.

Market information includes bids, offers and deals done by sources or seen/heard by sources. ICIS reporters also investigate the reasons for market price movements and cross-check information received during the course of this information gathering process against market fundamentals data, primarily gathered from transmission system operators.

Information is typically gathered between 10:00 and 17:30 London time on the day the assessment is published. ICIS may disregard information received after 17:30 London time.

Transactions eligible for inclusion in ICIS indices must have been conducted between 06:00 and 17:30 London time on an English working day.

On the working day immediately preceding 25 December and 1 January, ICIS assesses markets earlier and gathers transaction information between 09:00 and 13:15 London time.

Transactions eligible for inclusion in ICIS indices in the above circumstances must have been conducted between 06:00 and 13:15 London time.

ICIS will never use information received after indices have been published to retroactively correct an index.

Formulation of Heren Indices

ICIS publishes a variety of volume-weighted trade-based indices for different contracts. These are priced in pence/therm for the NBP and Zeebrugge markets and in €/MWh for all other markets. For the duration of the contract covered by the index, the price values flat gas, delivered on a no-swing, 100% take-or-pay basis.

Contract delivery periods are identical to those described above in Price Assessments – Definition of Periods.

Formulation of the Within-day index

Heren Within-day indices are volume-weighted averages of all Within-day transactions collected in ESGM on the same day for gas to be delivered on the specified market.

The Within-day index requires a minimum of three transactions. On days when there are fewer than three eligible transactions, the index is published as the arithmetic average of the previous 20 indices.

Formulation of the Cumulative Within-day index

The Cumulative Within-day index is a volume-weighted average price of all the Within-day transactions included in ESGM so far that calendar month, up to and including the publication date. On the first English working day of a new month, the Cumulative Within-day index will reset and will be identical to the Within-day index.

The cumulative index requires a minimum of three transactions. When there are fewer than three eligible transactions the index will not be displayed.

Formulation of the Day-ahead index

The Day-ahead index is a volume-weighted average price of all the Day-ahead transactions included in ESGM for gas to be delivered to the associated market.

The Day-ahead index requires a minimum of three transactions. On days when there are fewer than three eligible transactions, the index is published as the midpoint of the bid/offer price assessment published for the Day-ahead contract.

Formulation of the Cumulative Day-ahead index

The Cumulative Day-ahead index is a volume-weighted average price of all the Day-ahead trades included in ESGM so far that calendar month, up to and including the publication date. On the first English working day of a new month, the Cumulative Day-ahead index will reset and will be identical to the Day-ahead index.

The cumulative index requires a minimum of three transactions. When there are fewer than three eligible transactions the index will not be displayed.

Formulation of the Weekend index:

The Weekend index is a volume-weighted average price of all the Weekend transactions included in ESGM since the expiry of the previous Weekend contract and for gas to be delivered to the associated market. In a typical working week this would cover all Weekend transactions sourced between Monday and Friday before the period of delivery.

The index requires a minimum of three transactions. On days when there are fewer than three eligible transactions, the index is published as the average of the midpoints of the bid/offer Weekend price assessment published for that market during all the working days which fall in the same calendar week as the Weekend index and precede the previous index weekend.

Formulation of the Spot Weekend index

The Spot Weekend index is a volume-weighted average price of all the Weekend transactions included in ESGM on the date before the start of the delivery period. In a typical working week this would refer to all Weekend transactions sourced on a Friday.

The index requires a minimum of three transactions. On days when there are fewer than three eligible transactions the index is published as the midpoint of the bid/offer Weekend price assessment published for that market during the final working day immediately preceding the index weekend.

Formulation of the Monthly index

The Monthly index is calculated on the final working day prior to the start of delivery. The Monthly index is a volume-weighted average price of all the Month-ahead transactions included in ESGM for gas to be delivered to the associated market and which have been sourced since the start of the month prior to delivery.

The index requires a minimum of three transactions. When there are fewer than three eligible transactions, the index is published as the arithmetical average of the all the month-ahead bid/offer price assessment midpoints published for that market during the calendar month prior to the delivery month.

Formulation of the Monthly Cumulative index

The Monthly Cumulative index is a volume-weighted average of all month-ahead trades sourced since the start of the month prior to delivery. The index is updated on each working day. By the end of the month prior to delivery the Monthly Cumulative index will be the same as the Monthly index.

The index requires a minimum of three eligible transactions. When there are fewer than three eligible transactions, the index will display N/A.

Formulation of the Daily Month-ahead index

The Daily Month-ahead index is a volume-weighted average price of all the month-ahead transactions included in ESGM on the day of publication for gas to be delivered to the associated market.

The index requires a minimum of three transactions. When there are fewer than three eligible transactions, the index is published as the arithmetical midpoint of that market's month-ahead assessment published that day.

Other primary data tables in ESGM

ESGM trades tables – General and country-specific definitions

Trading data is published for the British, Belgian, Dutch, French, German, Austrian, Italian, Czech, Spanish and Turkish markets on a daily basis. Full trade listings are available by FTP download. The over-the-counter (OTC) transactions provided are those reliably identified by ESGM on the date of the report. Deals are listed by delivery date, volume and price.

Deals excluded by ICIS reporters as non-standard or anomalous are not included in this data.

Gas trades conducted in €/MWh are typically transacted in hourly clip sizes. The exception is the French market where transactions are done on a per day basis. Thus the French volumes published have been calculated by dividing the original traded volumes by 24 to obtain a €/MWh/hour figure consistent with neighbouring countries' trading units. This is then converted to produce a total volume. NBP and Zeebrugge transactions are done on a per day basis and then converted to produce a total volume.

In ESGM under the page with the title 'Trades' two tables are published. The first table shows the total volume traded in each market, in MWh, with a percentage breakdown of trade between curve and prompt contracts. Prompt is defined as all contracts with delivery up to Balance-of-month. Curve is defined as all contracts with delivery including and forwards of the front calendar month. The total number of trades is also listed.

The second table shows the daily high and low trades for each market for the following key contracts: Day-ahead, front month, front quarter, front season and front Calendar Year, all in MWh. If no trade has been reported then "n/a" will be shown.

Spark spreads

The British and German gas and power prices quoted in ESGM's Spark Spread tables are derived from the price assessment tables and daily indices in ESGM and sister publication European Daily Electricity Markets (EDEM). All the power prices quoted are for baseload delivery and, with the exception of Day-ahead, are the mid-point of the closing price assessment of the respective contract on the day of publication.

ICIS calculates the spark spread profit margin by taking the cost of power per MWh minus the cost of the gas needed to generate that power.

The cost is calculated using industry standard plant efficiencies to take account of energy not converted into electrical energy and therefore lost.

ICIS uses the standard gas-fired plant efficiency factor of 49.13%, an industry standard to allow for efficient spark spread trading, on the basis that 100,000 therms of gas could generate 60MW of power.

The spark spread value is therefore the power price minus the gas price divided by 0.4913, ie, spark spread = power price - (gas price/0.4913).

The UK gas price in pence/therm (British thermal unit) is converted to £/MWh by dividing by a standard factor of 2.93071.

A positive spread means that it is theoretically profitable to generate electricity for the period in question, while a negative spread means that generation would be a loss-making activity. However, it is important to note that the spreads do not take into account additional generating charges beyond fuel and carbon, such as operational costs.

ICIS uses the Day-ahead index value for Day-ahead electricity and gas values in Britain and Germany, and the midpoint of baseload power price assessment values for all other calculations.

For further information on the calculation of Spark Spreads please refer to the methodology document for European Daily Electricity Markets.

Secondary data in ESGM

ICE Natural Gas Futures

This table shows the closing (“settle”) prices for the natural gas futures contracts traded on the Intercontinental Exchange, ICE. Prices and other data are passed to ESGM by ICE at settlement time, currently between 16:00-16:15 London time. Close of business is 17:00 London time. “Change” is the change from the previous working day’s settlement price. “High” and “Low” represent the high and low traded prices for the day in question. “Lots” represents the volume of trade for each contract: 1 lot = 1,000 therms per day, although it should be noted that under current exchange rules the minimum trade size is five lots. “M th total” represents the total number of therms traded, expressed in millions of therms. “Open interest” represents the open interest for each contract at the previous day’s close. For further information, visit ICE’s website.

Day-Ahead Beach Terminal Capacity Prices

These are secondary market prices for British entry capacity at the most active beach terminals for the following working day. Prices are assessed by ESGM in the same manner and at the same time as spot commodity prices.

OCM SMP/SAP Report/OCM Trading figures

These tables provide a snapshot of the previous day’s activity on the On-the-day Commodity Market (OCM), which is operated by exchange group ICE Endex in order to physically balance the British gas system. Two tables are included and all information presented comes from TSO National Grid. The first shows the latest price and trade information from the current Gas Day as of 18:00 London time. The second table shows the OCM activity from the previous Gas Day. SAP (System Average Price) is the volume-weighted average of all OCM buys and sells on the day. SMP (System Marginal Price) Buy is the highest price at which National Grid bought gas for the system. SMP Sell is the lowest price at which National Grid sold gas out of the system. SAP 7-day and SAP 30-day are seven-day and 30-day rolling averages. For further information, please contact ICE Endex.

Oil market price assessments

ICIS publishes the front month ICE Brent crude price at 16:30 London time each day.

Gasoil and Fuel Oil prices are taken from the ICIS European Products report. The assessments value barges for a forward delivery window of 2-12 days and in the industry standard size of 1,000-5,000 tonnes.

The Gasoil 0.1% sulphur assessment is for barges on an FOB ARA basis. It uses German DIN quality in line with the IPE Gasoil Futures Contract. Cold properties vary seasonally.

The Fuel Oil 1% sulphur barge contract is for barges on an FOB ARA basis. It uses cracked material with a typical viscosity of 380cst at 50°C and a density of 0.965 to 0.990 at 15°C.

National Grid Daily Capacity Summary

These are National Grid daily auction average prices for Within-day firm and interruptible entry capacity at the nine most active British beach terminals. The table lists the average price paid, in pence per kilowatt hour (p/kWh), for both firm and interruptible capacity, as well as the total volume of capacity available as well as booked in kWh. For further information please contact National Grid.

Weather

Pan-European weather forecasts on a 1-5 day and 6-10 day basis are provided to ESGM by Weather Services International. For more information, please e-mail:energy@wsieurope.com or visit the company’s website.

Currency conversions

Forward currency rates are calculated using 29 pricing points, sourced from Bloomberg, at 16:30 London time every day. The pricing points used are all of those available: spot, one week ahead, 24 months ahead, and three to five years ahead.

Using these points, ICIS calculates a smooth curve which provides rates for each day out to five years. From these values, ICIS calculates rates corresponding to the contracts quoted in ESGM.

Other principles and guidelines

Changes to methodology

All markets evolve, and ICIS has a duty to ensure its methodologies for market-reporting evolve in step with markets.

ICIS therefore regularly conducts internal reviews of the appropriateness of its methodologies.

Draft changes are then made public and comment requested from industry participants, with a minimum one-month notice period, except where, exceptionally, a force majeure event (natural disaster, war, bankruptcy of a trading exchange etc) makes necessary a shorter notice period.

ICIS is committed to reviewing all comments on proposed methodology changes, but in some cases may find it necessary to alter its methodologies against the wishes of some market participants.

In addition, ICIS has a formal methodology consultation process. The company commits to holding this consultation every two years for ESGM. The date of the last consultation launched and the expiry date by which the company commits to conducting the next consultation can be seen at the top of the methodology document.

Please also refer to the Methodology Consultation Process section of the company's Compliance Manual. This contains detailed flow charts documenting the internal and external review and consultation process.

Consistency

ICIS achieves consistency between its assessors in exercising their judgement by requiring all assessors to understand and follow this detailed methodology as well as the company's Editorial Standards document. In addition, ICIS employees are required to complete standard training before undertaking the work of a market reporter. Every reporter's work is peer reviewed daily and spot checked by senior management.

Adherence to these processes is documented at every stage.

Data standards

ICIS has a public Data Standards Policy which covers the type and quality of information it asks market participants to report.

The following principles relate to ICIS gas market assessments and commentaries:

- Where possible, please allow access to active market traders and allow them to comment on active news stories.
- Where possible, please provide market data from both front and back-office functions.
- Where possible, please provide complete data and not a subsection.
- Flag inter-affiliate transactions.
- Flag sleeve trade.
- Flag spread trades.
- When a source or contact leaves the organisation please contact ICIS to the replacement (ICIS requests that both the source and the organisation contacts them).
- Where information is not validated by the source (i.e. rumour) please indicate as such.

Delivery locations

Locations for ICIS ESGM assessments and indices are chosen to reflect areas of traded liquidity. For most markets, delivery is at a virtual hub. Where trade takes place at a physical point on a network, ICIS may also provide a pricing reference for this point. The nature of the delivery point is described in the methodology document above in the section "Definitions of Hubs".

Key submitter dependency

Because of the sometimes thinly-traded nature of certain gas markets and the existence of markets where there are a limited pool of active counterparties, ICIS does not employ minimum rules on the number of submitters. This is particularly true of the newest European traded markets, where ICIS plays a key role in bringing price transparency and efficient trading to markets in the early stages of development.

For all markets ICIS only considers bid/offer data to be confirmed when it has been verified by three independent, non-affiliated sources. If this was not the case then ICIS will mark an assessment indicative. See section above, “Price Assessments – Indicative Assessments”.

Market Communication

ICIS communicates with a broad range of market participants – traders, brokers, back-office employees, supply managers, operations personnel and company executives – to obtain market information.

ICIS communicates with participants by telephone, email, instant messenger and face to face. All instant messenger, email communication and notes of any face-to-face communication are archived and details of telephone communication are logged and data-based.

ICIS does not accept instant messenger communication from unknown parties, and reporters are required to verify a market participant’s identity prior to using instant message communication.

ICIS does not regard in any way as binding, attempts by market participant companies to restrict ICIS communication with their employees. ICIS has a duty to its subscribers to obtain the maximum possible amount of market information. ICIS treats all communication from market participants as confidential.

ICIS reporters are bound by a Code of Conduct to report to their superiors any coercive or threatening communication from market participants, or any offers of inducements of any kind intended to influence an assessment.

Where improper communication appears to have taken place, ICIS will communicate in the first instance with senior management at the company or companies involved, and if necessary with relevant market authorities.

ICIS expects the highest standards of propriety from all market participants, and regards all communications from market participants as representative of the views of an individual’s employer.

ICIS is committed to the highest levels of customer service, and has a formal feedback and complaints policy, which can be viewed here <http://www.icis.com/about/icis-feedback-policy/>.

Market data verification

ICIS will always make best endeavours to confirm bids, offers and transactions with the relevant party/parties. ICIS attempts to cross-check all market data received from a buy or sell-side participant with a participant’s trading counterparty.

Where both counterparties to a transaction cannot or will not confirm the data, ICIS seeks corroboration from other market sources.

Where transaction or bid/offer information has been received from a trader rather than from a company’s back office, ICIS always seeks confirmation from other sources.

Where ICIS has grounds to doubt an item of market data, it may request further evidence that a transaction has taken place, including documentary evidence.

ICIS treats transaction data received from active brokerages as confirmed and treats bid/offer information as firm. This information will be considered in conjunction with other sources during the assessment and index process as described above.

In markets with low liquidity and a low number of counterparties, ICIS may choose to use unconfirmed data, but only in so far as it is aligned with other market information and comes from a source deemed reliable by ICIS based on previous interactions.

Minimum data threshold

Because of the sometimes thinly-traded nature of certain gas markets and contracts, ICIS does not have a minimum data threshold for its assessment methodologies in these markets. ICIS’ gas methodology is designed to function accurately under all market conditions and to make use of parallel data where no direct transaction or bid/offer data is available. See the section entitled “Price Assessments – Exercise of Judgement” above.

ICIS does implement a minimum data threshold for its indices, however. ICIS will not typically publish an index until it has at least six months’ worth of data showing that at least 10 deals have been completed for each index period.

When an index series is launched, ICIS publishes a minimum number of transactions an index must meet in order for a weighted average to be calculated. If the number of deals falls below this threshold, ICIS reverts to

a default methodology using its assessments or previous index values. These defaults are specified above in the section entitled “Indices – definitions”. ICIS does not consider such methodology switches desirable in terms of consistency and transparency and endeavours not to launch an index where it believes there is a likelihood that the minimum data threshold will not be met.

Quality specifications

The physical characteristics of the gas valued by ICIS in its assessments and indices is defined by the network operator of the virtual hub or physical infrastructure owner. For a list of these operating companies please see the section above entitled “Definitions of Hubs”.

Selection of participants

ICIS’ policy on general market data is that it welcomes all information regardless of source or constitution as long as it is provided in good faith as true.

However, only active market participants verified as such by existing active industry participants and verified as a viable business by ICIS investigations will be allowed to contribute price data to ICIS for the purpose of assessing tradable market value under this methodology.

Units

ICIS assesses gas markets in the units which attract the majority of trade. For most hubs in Europe, trading activity has conformed to one standard unit, usually either pence per therm (p/th) or euros per megawatt hour (€/MWh).

ICIS uses a conversion factor of 1 therm = 0.0293 MWh when such a conversion is required.

Units of energy are used for trading purposes in all active European markets, rather than units of volume.

In the early days of market development, however, there may be multiple units trading. ICIS will typically assess using the most regularly traded unit and publish parallel assessments in other active units.
